

Biocompatibility Testing of Dental Materials

By Bill Wolfe, DDS, NMD

With Office Locations in Albuquerque AND Santa Fe!

Effects of Dental Materials on Health

The simplest definition of biocompatibility is “the ability of a substance to exist within living things without harming them”. The biocompatibility of a dental material refers to the ability of the material to provide the desired function, without causing any undesirable local or systemic effects in the body. Therefore, the material should not cause any kind of allergic, toxic, and/or inflammatory response; nor any other undesirable reaction in the individual.

2,000 Different Dental Materials

Today, there are over 2,000 different dental materials in use, and no one material is 100% suited for everyone. Because each of us possesses a unique biochemistry, these substances affect each of us differently and to varying degrees. For some, the effects of certain substances (and their corrosion byproducts) can be toxic and hazardous, and may result in serious health problems. If you happen to be reactive to any one of the different metals, compounds, chemicals, and products used in dentistry, these materials could present a serious immune system challenge, or energetic blockage of the associated acupuncture meridians to distant areas of the body. Unlike a food, which can be readily removed from the diet, if you are reactive to a dental material and it is placed in your mouth; it's there...24 hours a day. (See “tooth to body” relationship chart at www.drwolfe.com).

Benefits of Testing for Biocompatibility of Dental Materials

Determining the compatibility of dental materials is important for those with existing allergies, because all diseases and health issues stress the immune system. If you are reactive to one or more dental materials, you are placing an extra burden on your immune system. The purpose of biocompatibility testing prior to dental treatment is to select the materials that are the least immune challenging before being placed in your mouth. The body is being constantly exposed to harm from everything from bacteria, viruses to environmental toxins, and even everyday stress. So why expose it unnecessarily to dental materials to which you may be reactive? You can't control your external, environmental pollution, but you can control the pollution in your mouth!

Biocompatibility Test for Dental Materials

The reactive or non-reactive affects to dental materials may vary in each of us, especially in patients with special health concerns. In my office, everyone is tested for biocompatibility of potential dental materials, to develop their “dental menu” of dental materials for use, when dentistry is required. In addition, we test for the most effective, least reactive local anesthetic at every visit.

The two methods of testing are:

1. Selective Kinesiology: Applied Kinesiology makes use of mus-

cle strength as an indicator of an organism's orderly or disturbed state of health. Muscle strength is influenced by the energy fields of objects in close association with the body. I utilize Kinesiology and a testing kit of all of the sample materials, which I may use in my dental treatment. A positive response (muscle strength) indicates a material which would be acceptable for that patient, while a negative response (muscle weakness) indicates a material that would not be chosen for that patient.

2. Materials Reactivity Testing: This is a laboratory screening process used to help identify existing sensitivity problems to various chemical groups in an individual patient. I use this form of testing with patients who are known to be very chemically sensitive. The test provides a list of all the commonly used dental materials and will evaluate whether you are suited or not well suited to over 2,000 individual dental materials.

In Conclusion

Everything must be considered if you want to effectively restore health and function. Dentistry is always a piece of the health puzzle, and sometimes... *it's a very vital, missing piece.*
